TMJ Anatomy. The temporomandibular joint (TMJ) or jaw joint is a bi-artroidal hinge joint that allows the complex movements necessary for eating, swallowing, talking and yawning. Posterior knee pain is a common patient complaint. Knee pain is more common in the anterior, medial, and lateral aspect of the knee than in the posterior aspect of the knee. The differential diagnoses for posterior knee pain include pathology to the bones, musculotendinous structures, ligaments, and/or to the bursas. Less common are neurologic and vascular injuries.
